Additional details for this test

Method(s):

Liquid-liquid-extraction after reduction; Determination using HPLC-DAD, HPLC-MS/MS and GC-MS(/MS)

DIN EN ISO 14362-1:2017-05^A and DIN EN ISO 14362-3:2017-05^A

Parameter hints:

o-Aminoazotoluene is detected indirectly by analysis of o-Toluidine.

2-Amino-4-nitrotoluene is detected indirectly by analysis of 2,4-Toluylenediamine.

2-Naphthylammoniumacetate is detected indirectly by analysis of 2-Naphthylamine.

2,4,5-Trimethylaniline Hydrochloride is detected indirectly by analysis of 2,4,5-Trimethylaniline.

4-Chloro-o-toluidiniumchloride is detected indirectly by analysis of 4-Chloro-o-toluidine.

4-Methoxy-m-phenylenediamine sulfate is detected indirectly by analysis of 2,4-Diaminoanisole.

Further Notes:

If necessary several test methods were carried out.

For aryl amines listed with a concentration of > 30 mg/kg:

It is suggested that the commodity submitted has been manufactured or treated using azo colorant/s, which are proscribed under Regulation (EC) REACH 1907/2006/Annex XVII.

If an aryl amine is listed with a concentration of ≤ 30 mg/kg, this means:

It can not necessarily conclude out of the analysis, that the commodity submitted has been manufactured or treated using azo colorant/s, which are proscribed under Regulation REACH 1907/2006/Annex XVII.

For 4-aminodiphenyl, 2-naphthylamine or 2,4-diaminoanisole:

The use of banned azo colorants cannot be reliably ascertained without additional information, e.g. the chemical structure of the colorants used.

For 4,4'-diaminodiphenylmethane or 2,4-toluylenediamine:

It is possible, that this arylamine has not been released from a banned azo colorant, but is present in free form or has a different source.

Result value details:

4-Chloro-o-toluidine/5-Chloro-o-toluidine

4-Chloro-o-toluidine and 5-Chloro-o-toluidine are not analytically separable, so that the determined value for both substances must be given combined.

4-Aminoazobenzene

Azo colorants that are able to form 4-aminoazobenzene, generate under the condition of some above mentioned methods aniline and 1,4-phenylenediamine. For the detection of 4-aminoazobenzene therefore additional methods are carried out if necessary.

Allergenic and carcinogenic colorants

Solvent Extraction; Determination using HPLC-DAD/MS and HPLC-MS/MS (DIN 54231:2022-09^A; Modification: number of analytes to be determined)

Parameter hints:

For the following substances no concentrations are shown, since no direct quantitation is possible:

Direct Black 38, Direct Red 28, Pigment Red 104, Pigment Yellow 34, Reactive Brown 51

Basic Blue 26 and Solvent Blue 4 are not analytically separable, so that the determined value for both substances must be given combined.

Basic Violet 1 and 4,4'-bis(dimethylamino)-4''-(methylamino)trityl alcohol are not analytically separable, so that the determined value for both substances must be given combined.
